Report: Implementing a Dynamic Product Listing Component

Prepared By: Areesha Nadeem

Prepared For: Project Day 4- Building Dynamic Frontend Components

Objective:

The primary objective of Day 4 is to design and develop dynamic frontend components that can display marketplace data fetched from Sanity CMS or external APIs. This process focuses on modularity, reusability, and applying real-world development practices to build scalable and responsive web applications.

Task Overview

Objective:

Build a Product Listing Component for a marketplace.

Requirements:

1. Fetch product data dynamically using Sanity CMS or an extemal APL

2. Display the data in a grid layout of cards with the following details:

- Product Name
- Price
- Image Stock Status

3. Ensure responsiveness across devices.

4. Implement modularity by breaking the component into smaller, reusable parts.

Tools & Technologies:

- Framework: React or Next.js
- CMS: Sanity CMS
- Styling: Tailwind CSS or plain CSS
- State Management: React Hooks

Implementation Plan

1. Set Up Data Fetching:

- Integrate Sanity CMS or API endpoints to fetch the product data dynamically.
- Use React hooks (useErrect) for data fetching and (uaastate) to store and manage the data

2. **Design Reusable Components**

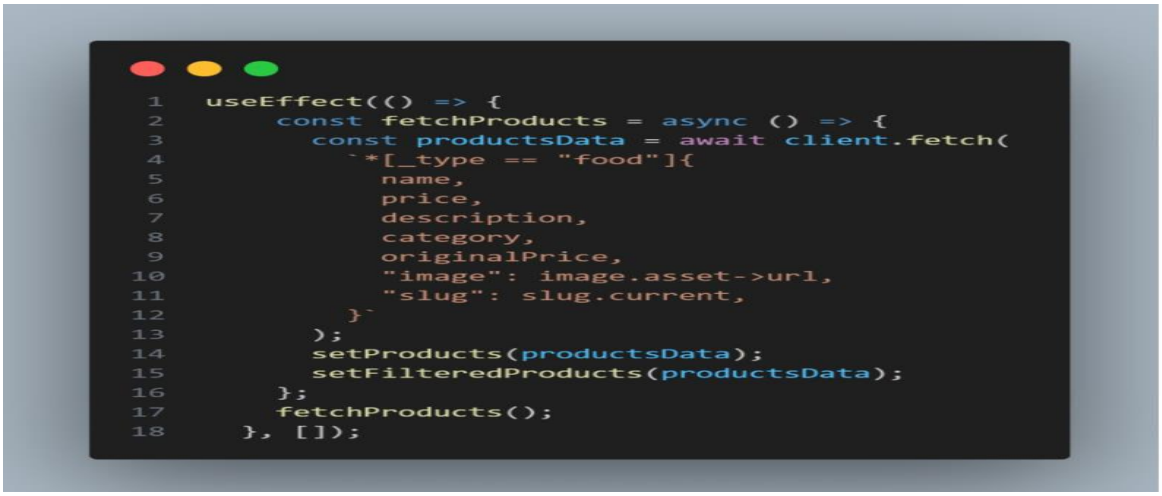
- Break down the Product Listing Component into smaller parts:
    - Product Card Component: Displays individual product details.
    - Grid Layout Component: Amanges the product cards in a responsive grid.

3. Apply Responsive Design:

- Use Tailwind CSS or CSS Grid/Flexbox to ensure the grid layout adapts to all screen sizes.

4. **Enhance User Experience:**

- Highlight important details like stock status with conditional formatting.
- Add hover effects for better interactivity.



```
useEffect(() => {
    const fetchProducts = async () => {
      const productsData = await client.fetch(
        `*[_type == "food"]{
          name,
          price,
          description,
          category,
          originalPrice,
          "image": image.asset->url,
          "slug": slug.current,
        }`
      );
      setProducts(productsData);
      setFilteredProducts(productsData);
    };
    fetchProducts();
  }, []);
```

2. Product Detail Component

Objective:

Develop individual product detail pages using dynamic routing in Next.js. These pages will display detailed information about each product, including:

- Name
- Product Description
- Price
- Category
- Stock Availability

Implementation Plan:

1**. Dynamic Routing:**

- Create dynamic routes using the [id].tsx file in the pages/products directory.
- Fetch product data based on the product ID from a CMS like Sanity or an API.

2. Data Fields:
Each product detail page should include the following fields:

- Product Description: A detailed explanation of the product, fetched from the backend.
- Price: Displayed prominently for clear visibility.

3. Integration with Product Listing:

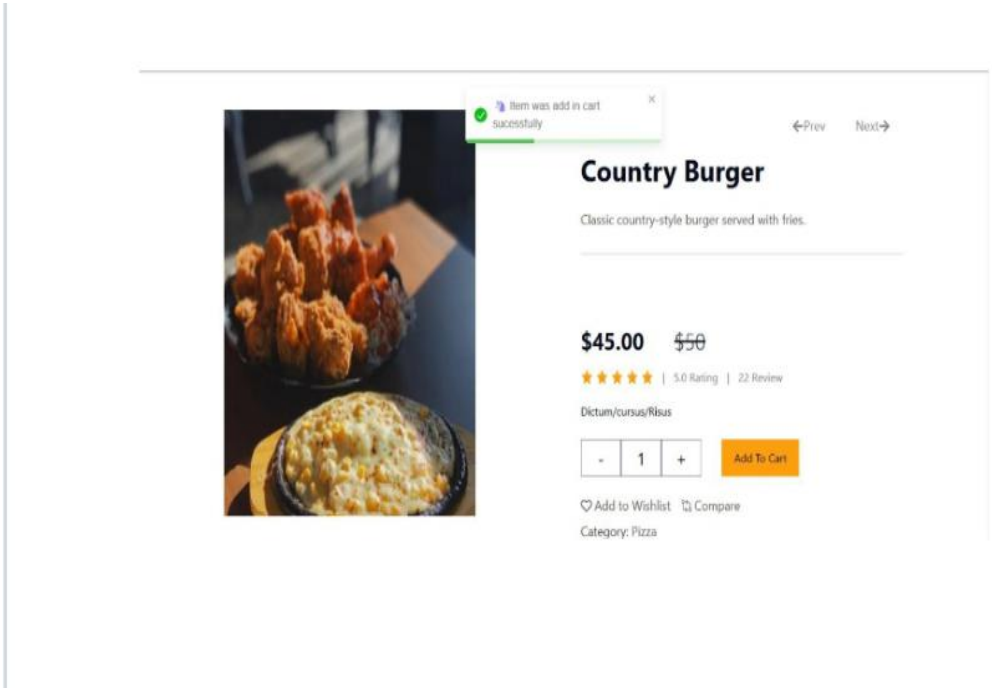
- Link each product card in the Product Listing Component to its corresponding detail.
- page using the link component in Next.js

4**. Styling and Layout:**

- Use Tailwind CSS or plain CSS for a clean and responsive design.
- Ensure the layout highlights the product description and price for user clarity.

```
async function Productpage({ params }: { params: { slug: string } }) {
  const product:IProduct =
    await client.fetch(`*[_type == "food" && slug.current == $slug][0] {
      name,
      description,
      price,
      originalPrice,
      tags,
      "imageUrl": image.asset->url,
      "slug": slug.current,
    }`,{slug:params.slug});
```

UI Display OF Product Detail Page:



Step 3: Search Bar with Price Filter

Objective:

To implement a search bar and price filters to enhance the product browsing experience.

Implementation Plan:

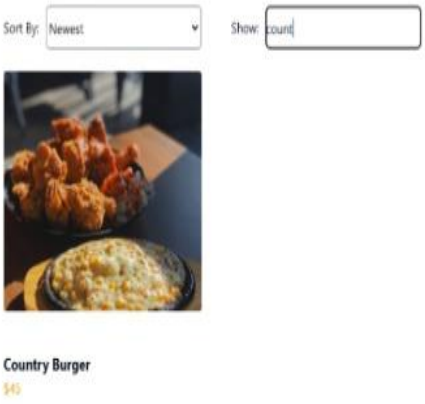
1. Search Bar Functionality:

- **Filter products based on their name or associated tags.**
- **Update the product list in real-time as the user types.**

```tsx
// Handle search
 const handleSearch = (event: React.ChangeEvent<HTMLInputElement>) => {
   const query = event.target.value.toLowerCase();
   setSearchQuery(query);

   const filtered = products.filter(
     (product) =>
       product.name.toLowerCase().includes(query) ||
       product.description.toLowerCase().includes(query) ||
       product.category.toLowerCase().includes(query) ||
       product.slug.toLowerCase().includes(query)
   );
   setFilteredProducts(filtered);
 };
```

UI Display :



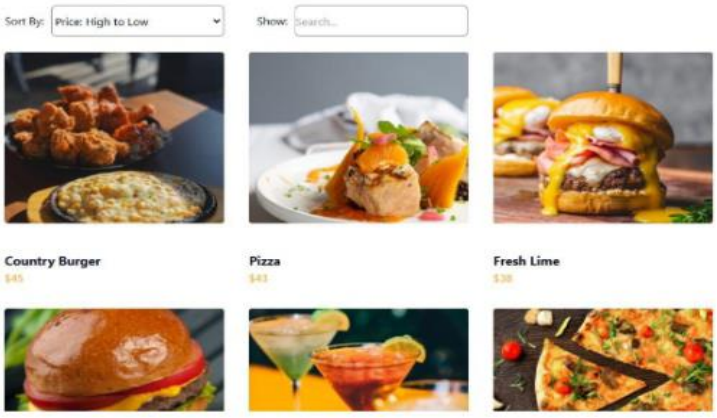
2. **Price Filtering:**
    - Add options to sort products by price in **ascending** or **descending** order.
    - Combine the price filter with the search bar and category filter for seamless interaction

```
// Handle sorting
  const handleSort = (event: React.ChangeEvent<HTMLSelectElement>) => {
    const sortValue = event.target.value;
    setSortOrder(sortValue);

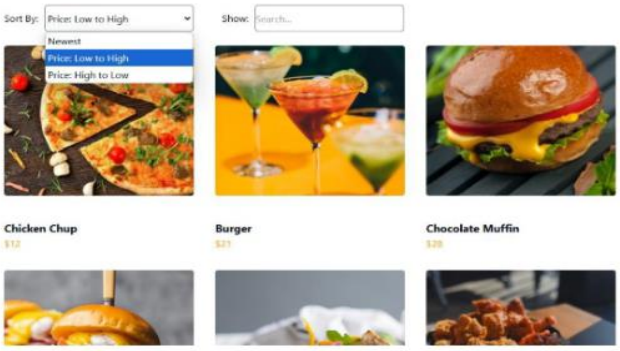
    let sortedProduct = [...products];
    if (sortValue === "lowToHigh") {
      sortedProduct.sort((a, b) => a.price - b.price);
    } else if (sortValue === "highToLow") {
      sortedProduct.sort((a, b) => b.price - a.price);
    }
    setFilteredProducts(sortedProduct);
  };
```

UI Display:

- ***High To Low:***



- ***Low To High:***



Features Implemented:

1. **Search Bar:**
   - Filters products by name or tags in real time.
2. **Price Filter:**
   - Allows sorting products by price (low to high or high to low).

Step 4: Cart Component

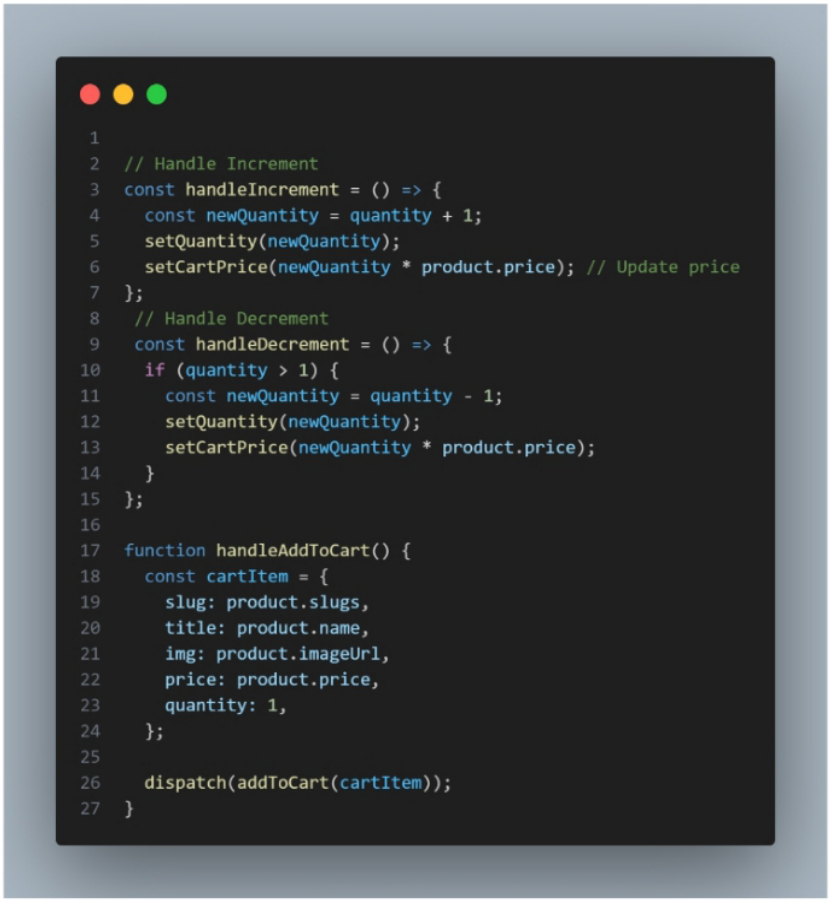
Objective:

To create a **Cart Component** that displays the items added to the cart, their quantity, and the total price of the cart dynamically.

Implementation Plan:

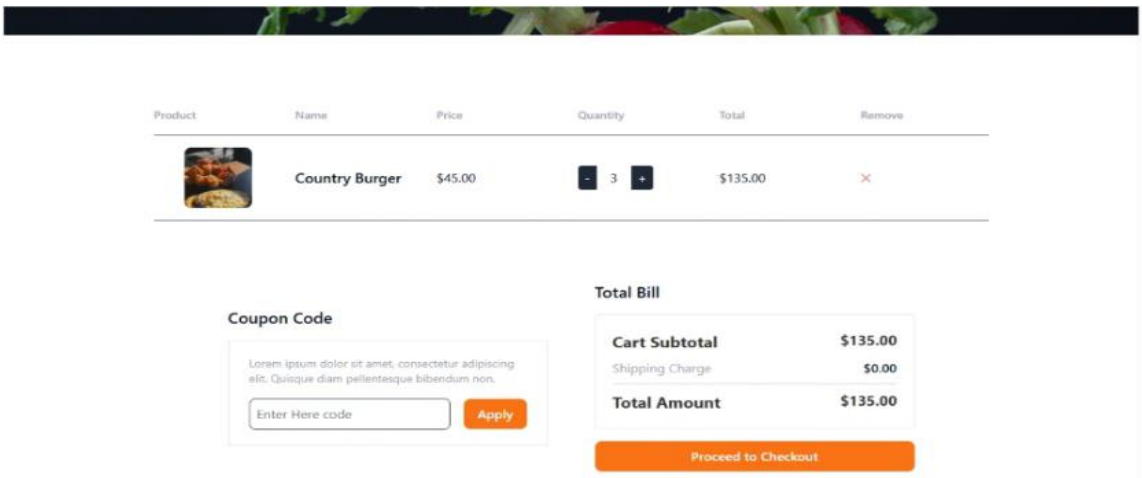
1. **State Management:**
   - Use **React state** or a state management library like Redux for storing cart data.
2. **Cart Data:**
   - Include details for each product in the cart:
     - Product Name
     - Price
     - Quantity
   - Calculate and display the **total price** dynamically based on the items in the cart.

3. **Cart Interactions:**
    - Allow users to **increase or decrease the quantity** of items.
    - Automatically update the total price when the quantity changes.



```
1
2  // Handle Increment
3  const handleIncrement = () => {
4    const newQuantity = quantity + 1;
5    setQuantity(newQuantity);
6    setCartPrice(newQuantity * product.price); // Update price
7  };
8   // Handle Decrement
9   const handleDecrement = () => {
10   if (quantity > 1) {
11     const newQuantity = quantity - 1;
12     setQuantity(newQuantity);
13     setCartPrice(newQuantity * product.price);
14   }
15 };
16
17 function handleAddToCart() {
18   const cartItem = {
19     slug: product.slugs,
20     title: product.name,
21     img: product.imageUrl,
22     price: product.price,
23     quantity: 1,
24   };
25
26   dispatch(addToCart(cartItem));
27 }
```

UI Display Of Cart Page:



Features Implemented:

1. **Dynamic Item Display:**
   - Each item in the cart is displayed with its name, price, and quantity.
   - Subtotal for each item is dynamically calculated.
2. **Quantity Update:**
   - Buttons to increase (+) or decrease (−) the quantity of an item.
   - Quantity cannot go below `1`.
3. **Total Price Calculation:**
   - The total price updates dynamically as items are added or quantities are changed.
4. **Remove Item:**
   - Users can remove individual items from the cart.

Step 6: Notifications Component

Objective:

To create a **Notifications Component** that displays real-time alerts for user actions, such as adding items to the cart, encountering errors, or completing a successful purchase.

Implementation Plan:

1. **Real-Time Alerts:**
   - Use **toast notifications** or **modal windows** to display alerts.
   - Display notifications for actions like:
     - Item added to the cart
     - Errors (e.g., "Out of stock")
     - Successful actions (e.g., "Purchase complete")
2. **Integration:**
   - Trigger notifications at appropriate moments in the app, such as adding to the cart or completing a transaction.
3. **Libraries:**
   - Use a popular notification library like **react-toastify** or build a custom notification system.

```
const handleNotification = () => {toast.success('🦄 Item was add in cart sucessfully', {
  position: "top-center",
  autoClose: 2000,
  hideProgressBar: false,
  closeOnClick: false,
  pauseOnHover: true,
  draggable: true,
  progress: undefined,
  theme: "light",
  transition: Bounce,
  });
}
```

Conclusion

On **Day 4** of building dynamic frontend components for a marketplace, the focus was on creating modular, reusable, and responsive components. The following key components were successfully implemented:

1. **Product Listing Component:**
   - Dynamically displayed products in a grid layout with details such as product name, price, image, and stock status.
2. **Product Detail Component:**
   - Built individual product pages using dynamic routing in Next.js, including fields like product description, price, and image.
3. **Search Bar and Filters:**
   - Implemented functionality to filter products by name or tags and added price filters (high to low and low to high).
4. **Cart Component:**
   - Displayed items added to the cart, quantity management, and total price calculation with dynamic updates.
